3.3 Adaugare metoda de livrare, curier-standard sau Posta romana, Din settings se acceseaza Shipping and delivery, apoi la Shipping se modifica Shipping Origins cu Add rate.

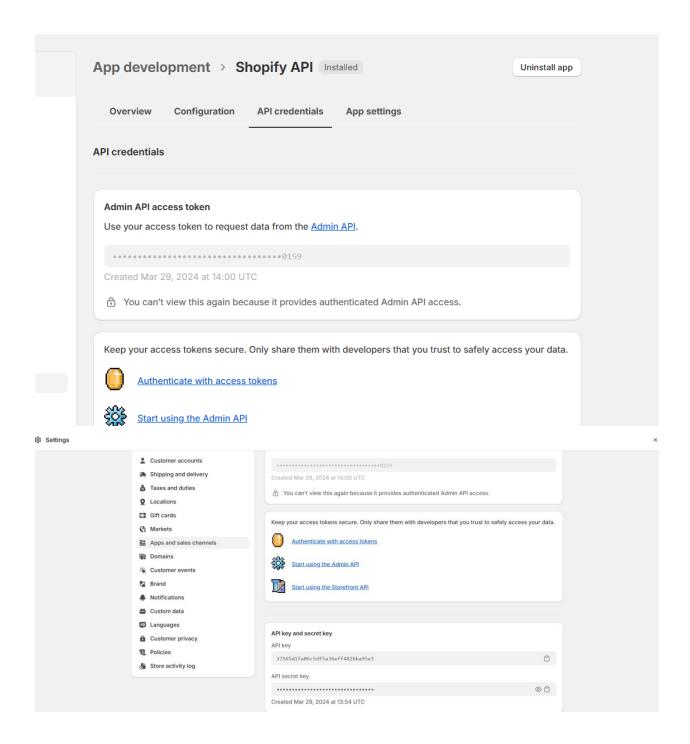

9.1 In cadrul integrarii cu get, va trebui sa intram in Settings pe Apps and sales channels s i a cream o noua aplicatie pe care mai apoi o vom instala magazinului: Develop apps-> Create apps

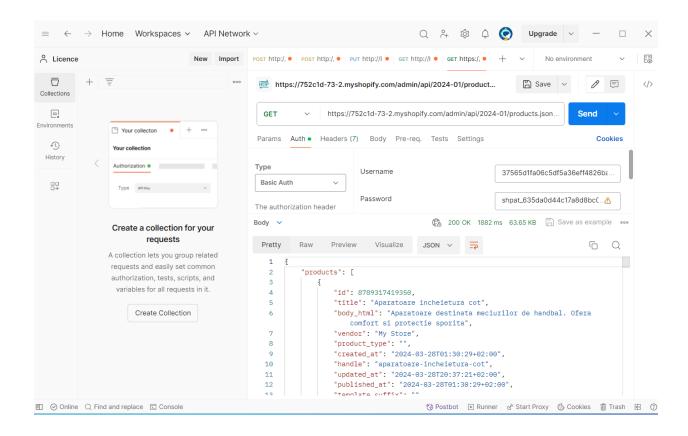

Setam drepturile aplicatiei pe obiectele magazinului (intr-un final le-am bifat pe toate, dar nu era nevoie), iar apoi instalam aplicatia in magazin

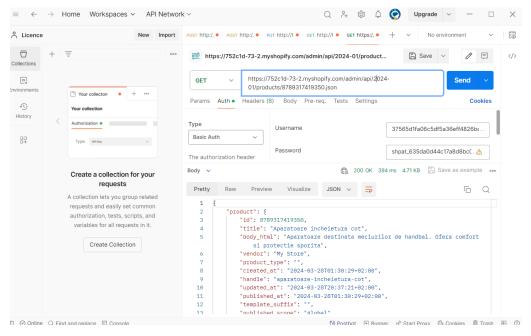

Se vor genera niste credentiale, un Access token ce va avea rol de parola si un API Key ce va fi folosit ca username. Aceste date se vor completa in Postman in sectiunea Basic Auth.

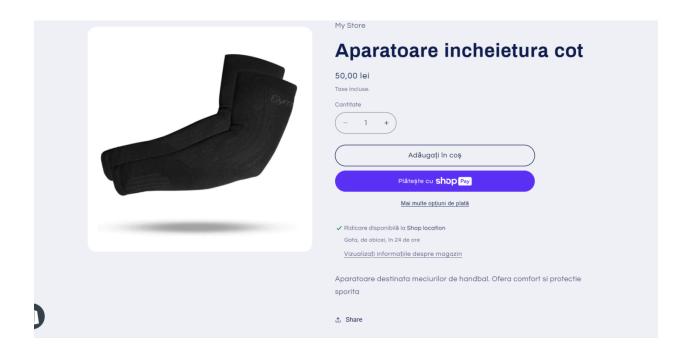

Efectuam apelul de GET din Postman pentru produse si observam ca le primim inapoi pe toate cu success, la ruta: <a href="https://752c1d-73-2.myshopify.com/admin/api/2024-01/products.json.2024-01">https://752c1d-73-2.myshopify.com/admin/api/2024-01/products.json.2024-01</a> va fi versiunea de API pe care ruleaza aplicatia(se poate vedea tot in setari aplicatie)

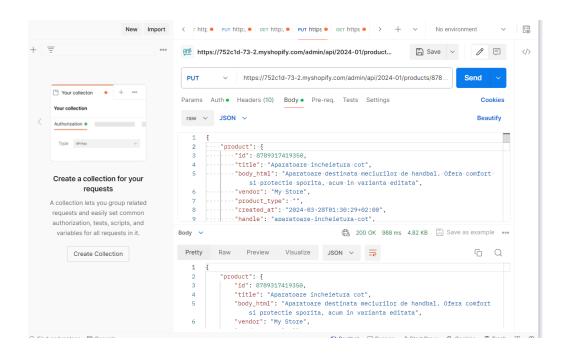

Aici vom efectua un apel de get pe un singur produs, dupa ID: <a href="https://752c1d-73-2.myshopify.com/admin/api/2024-01/products/8789317419350.json">https://752c1d-73-2.myshopify.com/admin/api/2024-01/products/8789317419350.json</a>, unde 8789317419350 este ID produs

Acum pentru metoda PUT(initial am incercat POST pe obiect cu ID si nu mergea, editarea merge doar cu PUT), observam in frontend obiectul inainte de a fi editat

Face apelul din Postman cu metoda PUT la adresa <a href="https://752c1d-73-2.myshopify.com/admin/api/2024-01/products/8789317419350.json">https://752c1d-73-2.myshopify.com/admin/api/2024-01/products/8789317419350.json</a> si cu un body. Am modificat doar descrierea. Metoda intoarce 200OK adica succes

## Revenind in frontend, observam ca modificarile s-au efectuat cu succes
